

UA3 – Travail pratique / Devoir #2

Déploiement cloud de l'API de prédition du diabète

Nom : Innocent Niyobuhungiro

Cours : UA3 – Méthodologie IA

Date : 2025-12-03

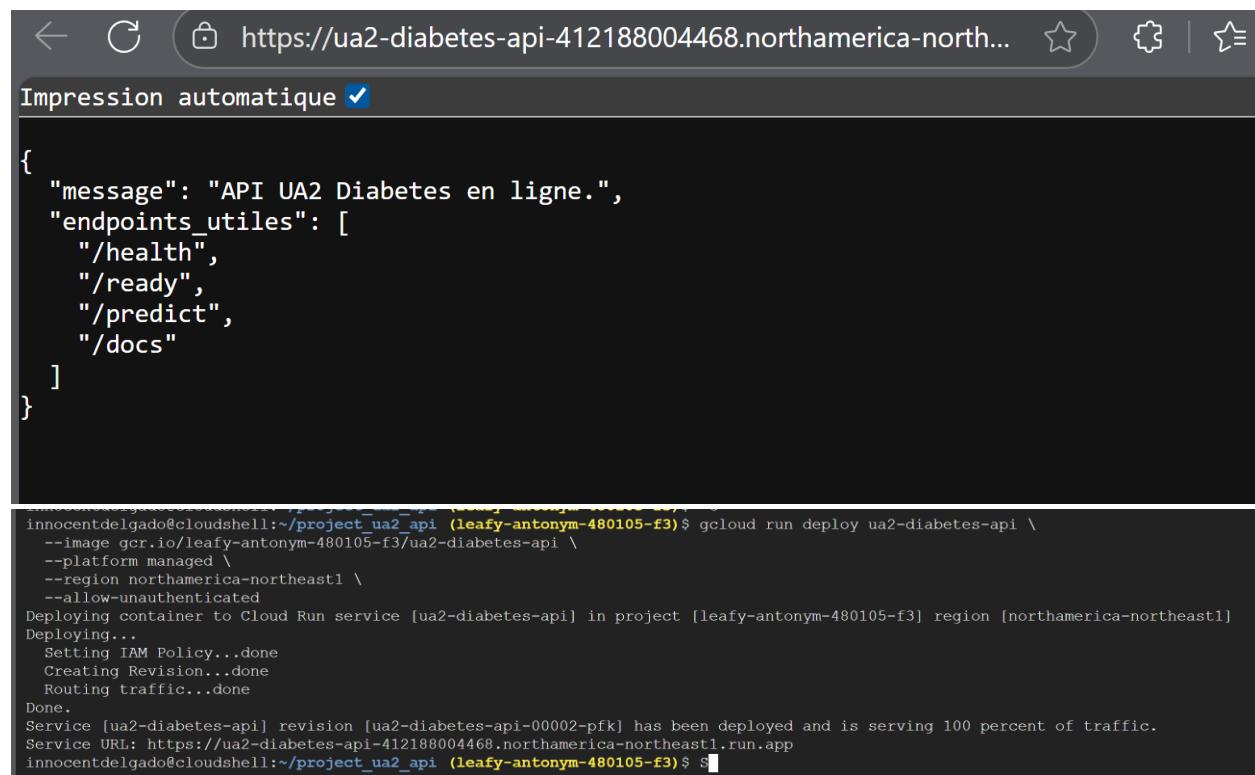

1. URL publique de l'API

L'API de prédition du diabète déployée sur Google Cloud Run est accessible à l'adresse suivante :

<https://ua2-diabetes-api-412188004468.northamerica-northeast1.run.app>

L'endpoint principal de prédition est : /predict

2. Capture d'écran de la requête de test

The screenshot shows a browser window with the URL <https://ua2-diabetes-api-412188004468.northamerica-northeast1.run.app>. The page displays the API's OpenAPI specification, which includes the message "API UA2 Diabetes en ligne." and a list of endpoints: "/health", "/ready", "/predict", and "/docs". Below the browser is a terminal window showing the command-line output of deploying the API to Google Cloud Run. The deployment process involves setting up the IAM Policy, creating a revision, and routing traffic. The final message indicates that the service has been deployed and is serving 100 percent of traffic at the specified URL.

```
innocentdelgado@cloudshell:~/project_ua2_api (leafy-antonym-480105-f3)$ gcloud run deploy ua2-diabetes-api \
--image gcr.io/leafy-antonym-480105-f3/ua2-diabetes-api \
--platform managed \
--region northamerica-northeast1 \
--allow-unauthenticated
Deploying container to Cloud Run service [ua2-diabetes-api] in project [leafy-antonym-480105-f3] region [northamerica-northeast1]
Deploying...
Setting IAM Policy...done
Creating Revision...done
Routing traffic...done
Done.
Service [ua2-diabetes-api] revision [ua2-diabetes-api-00002-pfk] has been deployed and is serving 100 percent of traffic.
Service URL: https://ua2-diabetes-api-412188004468.northamerica-northeast1.run.app
innocentdelgado@cloudshell:~/project_ua2_api (leafy-antonym-480105-f3)$ S
```

```

3. Brève description de l'architecture (Docker + Cloud Run)

L'API est développée avec FastAPI et charge un modèle de Gradient Boosting sauvegardé dans le fichier best_model_GB_opt.joblib pour prédire le risque de diabète à partir de variables cliniques. L'application est empaquetée dans une image Docker construite avec Google Cloud Build, puis stockée dans Container Registry sous le nom gcr.io/leafy-antonym-480105-f3/ua2-diabetes-api. Cette image est ensuite déployée sur Google Cloud Run en mode fully managed, ce qui permet d'exposer publiquement les endpoints /health, /ready, /predict et /docs via l'URL de service ci-dessus. L'accès est configuré en "allow-unauthenticated", ce qui permet d'appeler l'API directement depuis n'importe quel client HTTP (curl, Postman, navigateur).
